Suno Item Ref
for Dynamics 365 Business Central

Item Ref complements the Business Central standard and thus enables the use of item codes and item reference numbers in a more flexible and specific manner.

The application is intended for anyone who needs additional functionality to manage item codes and item reference numbers.

Main features

Item reference list configuration to complement the logic of using item reference numbers on purchase and sales orders

Configuration of item codes on printouts of purchase and sales documents in relation with item reference list

Vendor and customer based configuration of item codes on printouts of purchase and sales documents in relation with item reference list

The functionality of the printouts does not affect the standard Business Central printouts and allows the functionality to be used through other applications (for example, Suno Base)
